Abstract

In this experiment, we going to practice building a secure connection between two hosts by setting up an IPsec connection using two virtual machines.

Introduction

IPsec is a set of protocols and algorithms that are used together to protect the data that was transmitted over the internet or any public network. IPsec is a secure internet protocol because adds encryption and authentication on routing processing, by adding two headers in the IP packet: Authentication Header (AH), and Encapsulation Security Payload (ESP).And, here is two-mode where IPsec protection is applied: the transport mode and tunnel mode.

IPsec includes some protocols that are used in key exchange and key management.

Authentication Header (AH) also provides data integrity and authentication, it does not provide encryption so it does not protect data confidentiality.

Encapsulation Security Payload (ESP) provides data integrity, authentication and encryption.

Internet Key Exchange (IKE) It`s a built-in IPsec protocol that is used as the default key management protocol under the IPsec domain.

Finally, Key management can be done manually, but when it comes to large networks, this is not scalable, so IKE is used in this case.

Procedure

I. Host-to-Host IPSec Communication:

1. In the first, build a simple peer-to-peer network using two linux machines (virtual or standalone). In this experiment the IP address of the two PCs is 172.16.107.29 and 172.16.107.33.

2. Now, make sure that each host is reachable by other by using ping command.

3. There is some basic requirement to create a host-to-host secure communication are:

- a. The IP address for both hosts.
- b. A unique name to identify the IPsec connection and distinguish it from other devices or connections (for example, ipsec0)
- c. A fixed encryption key or one automatically generated by racoon.
- d. A pre-shared authentication key that is used to initiate the connection and exchange encryption keys during the session.

4. Install the IPSec tool with all its needed dependencies using the command:

```
sudo apt-get install -y ipsec-tools
```

5. Open the IPSec configuration file ipsec.conf. At the end of the file, add the following lines with the IPs you have used in your network:

```
conn host-to-host  
authby=secret  
auto=route  
keyexchange=ike  
left=172.16.107.29  
right=172.16.107.33  
type=transport  
esp=aes128gcm16!
```

Make sure that the left and right IP addresses are the same in two devices.

The previous lines means:

conn host-to-host: is the connection here is host to host connection.

authby=secret: means the authentication is secret.

auto=route: on demand the IKE daemon will load connections with auto=route and install trap policies.

keyexchange=ike: the key management here is the internet key exchange.

left=172.16.107.29: the IP address of the left host (IP of device x).

right=172.16.107.33: the IP address of the right host (IP of device y).

type=transport: mode type is transport mode.

esp=aes128gcm16!: the encryption algorithm is aes128gcm16.

6. Open the file ipsec.secrets under the etc directory.

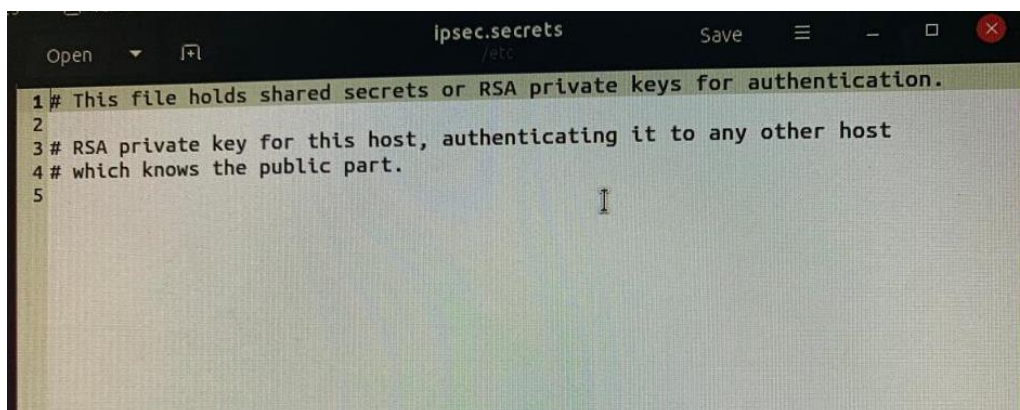

Figure1.1 shows the contains of file ipsec.secrets.

As it shows in figure1.1, file ipsec.secrets contain some comments that show the private key is an RSA key and will use in the authentication part.

Now, add the following line to the file ipsec.secrets. Make sure to include the IPs you have in your network instead of IPX and IPY. In addition, choose a strong password that meets the general security requirements.

IPX IPY : PSK "Your password here!".

In this experiment we write: **172.16.107.29 172.16.107.33 : PSK "Dyaa12345678"**

7. Now re-start the IPSec process by using this command:

sudo ipsec restart

We need to re-start IPsec to apply the changes that were done on `ipsec.conf`, and `ipsec.secrets` files.

8. Run the command **`ipsec statusall`**, to return detailed status information on the connection.

```
student@linux:/etc$ sudo ipsec statusall
Status of IKE charon daemon (strongSwan 5.8.2, Linux 5.13.0-28-generic, x86_64):
uptime: 63 seconds, since Feb 22 14:28:29 2022
malloc: sbrk 1617920, mmap 0, used 515136, free 1102784
worker threads: 11 of 16 idle, 5/0/0/0 working, job queue: 0/0/0/0, scheduled: 0
loaded plugins: charon aesni aes rc2 sha2 sha1 md5 mgf1 random nonce x509 revocation constraints pu
bkey pkcs1 pkcs7 pkcs8 pkcs12 pgp dnskey sshkey pem openssl fips-prf gmp agent xcbc hmac gcm drbg att
r kernel-netlink resolve socket-default connmark stroke updown eap-mschapv2 xauth-generic counters
Listening IP addresses:
172.16.107.29
Connections:
host-to-host: 172.16.107.29...172.16.107.33 IKEv1/2
host-to-host: local: [172.16.107.29] uses pre-shared key authentication
host-to-host: remote: [172.16.107.33] uses pre-shared key authentication
host-to-host: child: dynamic === dynamic TRANSPORT
Routed Connections:
host-to-host{1}: ROUTED, TRANSPORT, reqid 1
host-to-host{1}: 172.16.107.29/32 === 172.16.107.33/32
Security Associations (0 up, 0 connecting):
none
student@linux:/etc$
```

Figure1.2 shows the status of IKE charon daemon.

The last figure shows the IP address of hosts in this connection, the type of the keys that are used, the mode of this connection, and shows the routed connections information.

9. Finally, do the same steps from 4-8 on the other host.

II. Testing the Constructed Tunnel:

1. Issue a ping command from the first host (x) to the second host (y), with packet size equal 4048. That's done by using this command:

`ping -s 4048 172.16.107.33`

2. Run the command **`watch ipsec statusall`**. This command shows the status of the connection, and depending on the information there is a difference in the security associations between Figure1.2 and Figure1.3 (in the next page).

In Figure1.2 there are no security associations, but in Figure1.3 there are security associations between the two hosts using the IKE protocol.

```

student@linux: /etc
linux: Tue Feb 22 14:40:07 2022

Every 2.0s: ipsec statusall

Status of IKE charon daemon (strongSwan 5.8.2, Linux 5.13.0-28-generic, x86_64):

    host-to-host(2): AES_GCM_16_128, 337672 bytes_i (99 pkts, 1s ago), 337672 bytes_o (99 pkts, 1s ago), rekeying in 43 minutes
    host-to-host(2): 172.16.107.29/32 == 172.16.107.33/32

```

Figure1.3 shows the status of the connection.

3. Use tcpdump to capture ESP packets. Write those packets to a file named ESP.cap. Then using Wireshark open ESP.cap file and captured all ESP packets.

Time	Source	Destination	Protocol	Length	Info
3 0.000170	172.16.107.33	172.16.107.29	ESP	1246	ESP (SPI=0xc8f1a5d9)
6 0.000230	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc5307351)
9 0.335365	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc8f1a5d9)

35 2.002713	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc5307351)
38 2.338168	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc8f1a5d9)
41 2.340862	172.16.107.33	172.16.107.29	ESP	1246	ESP (SPI=0xc8f1a5d9)
52 3.004148	172.16.107.33	172.16.107.29	ESP	1246	ESP (SPI=0xc5307351)
55 3.004459	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc5307351)
59 3.340176	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc8f1a5d9)
62 3.343248	172.16.107.33	172.16.107.29	ESP	1246	ESP (SPI=0xc8f1a5d9)
65 4.006032	172.16.107.33	172.16.107.29	ESP	1246	ESP (SPI=0xc8f1a5d9)
68 4.006158	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc5307351)
74 4.342231	172.16.107.29	172.16.107.33	ESP	1246	ESP (SPI=0xc5307351)

Figure1.4 shows some ESP caputred packets with there SPI vlaue.

4. Show the Security Associations (SAs) that have been implemented on the first host (x) , by using **ipsec_spi** command or from **ipsec statusall** command.

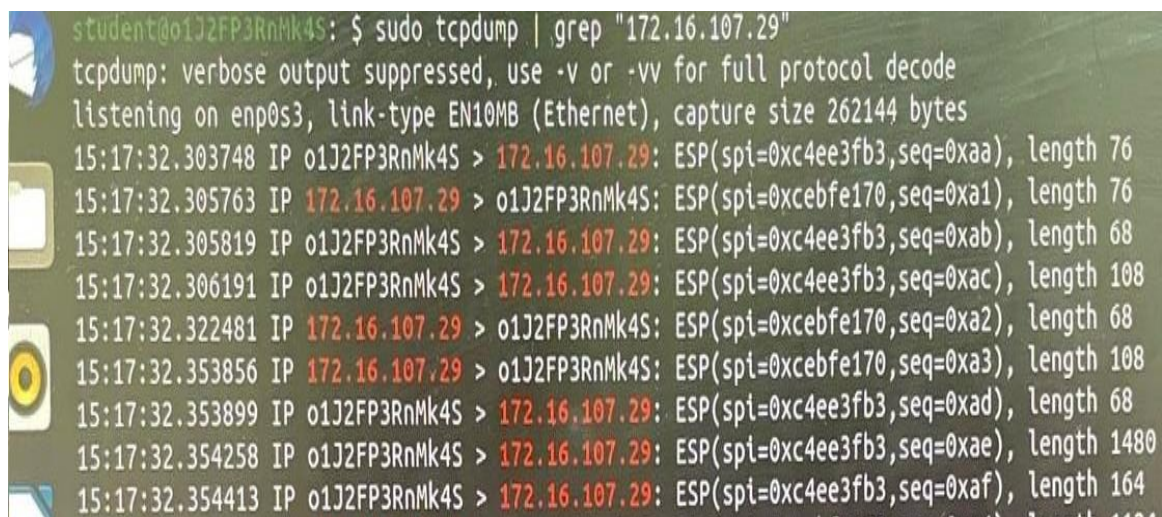

5. Now do ping from the second host (y) to the first host (x). Capture an ESP packet on the first host and check its SPI.

6. Change the pre-shared key value in one of the hosts, restart the IPsec process, and do ping again. Is there any captured packet?

There are no captured packets because there are no packets sent between two hosts; because this type of connection required have a pre-shared key between the hosts, so when changing the password there is no pre-shared key between two hosts.

III. SSH With the Constructed Tunnel:

1. Install an SSH client on both machines. Make sure that it is installed using the command `ssh`.
2. Install an SSH server on both machines. If it is not installed, then you have to use the following command:
`sudo apt-get install openssh-server ii.`
3. Run the `tcpdump` on one machine and try to capture ESP packets.
4. Connect SSH from one machine to another. You can use the command **`ssh username@host-ip-address`** with the password of the host you are connecting to
5. Capture ESP packets.

```
student@o1J2FP3RnMk4S: $ sudo tcpdump | grep "172.16.107.29"
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on enp0s3, link-type EN10MB (Ethernet), capture size 262144 bytes
15:17:32.303748 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xaa), length 76
15:17:32.305763 IP 172.16.107.29 > o1J2FP3RnMk4S: ESP(spi=0xc4ee3fb3,seq=0xab), length 76
15:17:32.305819 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xab), length 68
15:17:32.306191 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xac), length 108
15:17:32.322481 IP 172.16.107.29 > o1J2FP3RnMk4S: ESP(spi=0xc4ee3fb3,seq=0xa2), length 68
15:17:32.353856 IP 172.16.107.29 > o1J2FP3RnMk4S: ESP(spi=0xc4ee3fb3,seq=0xa3), length 108
15:17:32.353899 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xad), length 68
15:17:32.354258 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xae), length 1480
15:17:32.354413 IP o1J2FP3RnMk4S > 172.16.107.29: ESP(spi=0xc4ee3fb3,seq=0xaf), length 164
```

`tcpdump` command was used to listen on the traffic of the network card, incoming and outgoing, we were looking for an ESP packet. For the first ESP packet in the picture, it shows that `tcpdump` gives us the time this packet was sent, source and destination IP address,

the SPI value for the ESP packet since IPsec is applied, And the length of the packet.

Conclusion

In the end, in this experiment, we learned about how to make an IPsec connection between hosts, what is the main acquirement to build the connection, and how to open an SSH connection with the constructed tunnel.
